What Is It: InboxLock is software that removes and blocks emails based on your decisions. It eliminates the need for opt-out lists or spam filters.

What Makes It Unique: Modern spam protection services utilize a "one size fits all" technique. Emails spam are ranked on the collective email data of users email accounts. In short, this is why they do not work. Anything that makes decisions for the general public based on a set of predefined rules is going to be circumvented by spammers and solicitors. The unique embedded InboxLock algorithim (or brain) learns on an individual level. It is an infant that only learns when you teach it the difference between right (don't block) and wrong (block). It learns on the fly and will remove or allow emails based on what you tell it to do.

Features:
- ability to connect multiple email accounts
- information display for the current email
- list views for allowed, blocked or skipped emails
- a counter for emails left to take action on
- a label at the top for emails already dealt with (safe, blocked, skipped)
- Four options including:
1. allow an email through
2. block an email and all future emails from a sender
3. delete a single email but allow future emails from a sender
4. skip an email to take action at a later time

Why Is It Important: It gives the public back the freedom of what was once a private place (our email accounts) and eliminates information we otherwise don't need to see, increasing our productivity.
